

IEA-P – DEPARTAMENTO DE PROJETOS
(PROJECT DEPARTMENT)

OPM – OBJECT PROCESS METHODOLOGY

Session 05

Prepared by Prof. Dr. Christopher Shneider Cerqueira

Review and Motivations

Review

- SE -> (MB)SE
- There is a more generic SE language: SysML
 - Needs to be heavily tailored before used.
 - Drove to create modellers rather than systems engineers.
- Methodologies are being created with tied languages.
 - OPM / Arcadia
- The big challenge is to use models into a SE pipeline.

The start:

How do we explain ideas to each other?

Grab a pen and piece of paper, or a chalk and blackboard

Scribble shapes with names next to them

While talking, run lines with or without arrows among the shapes

Follow the reaction of the audience to see if idea is understood

Answer questions, continue scribbling...

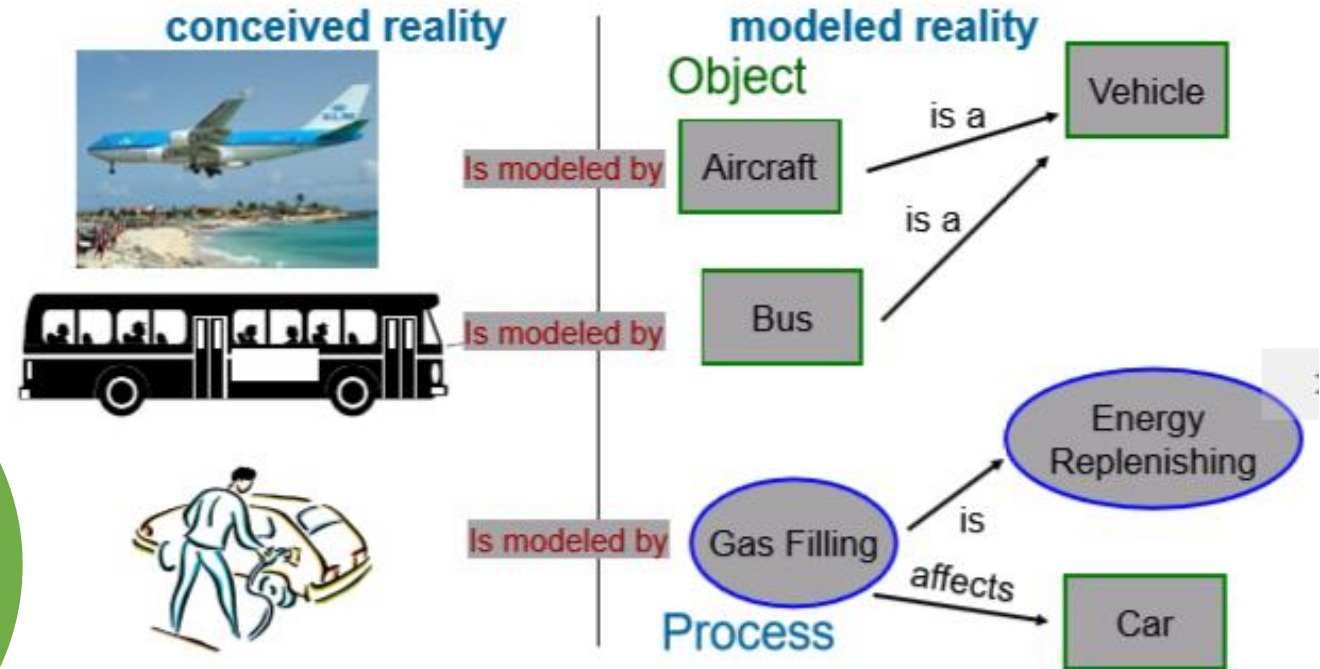

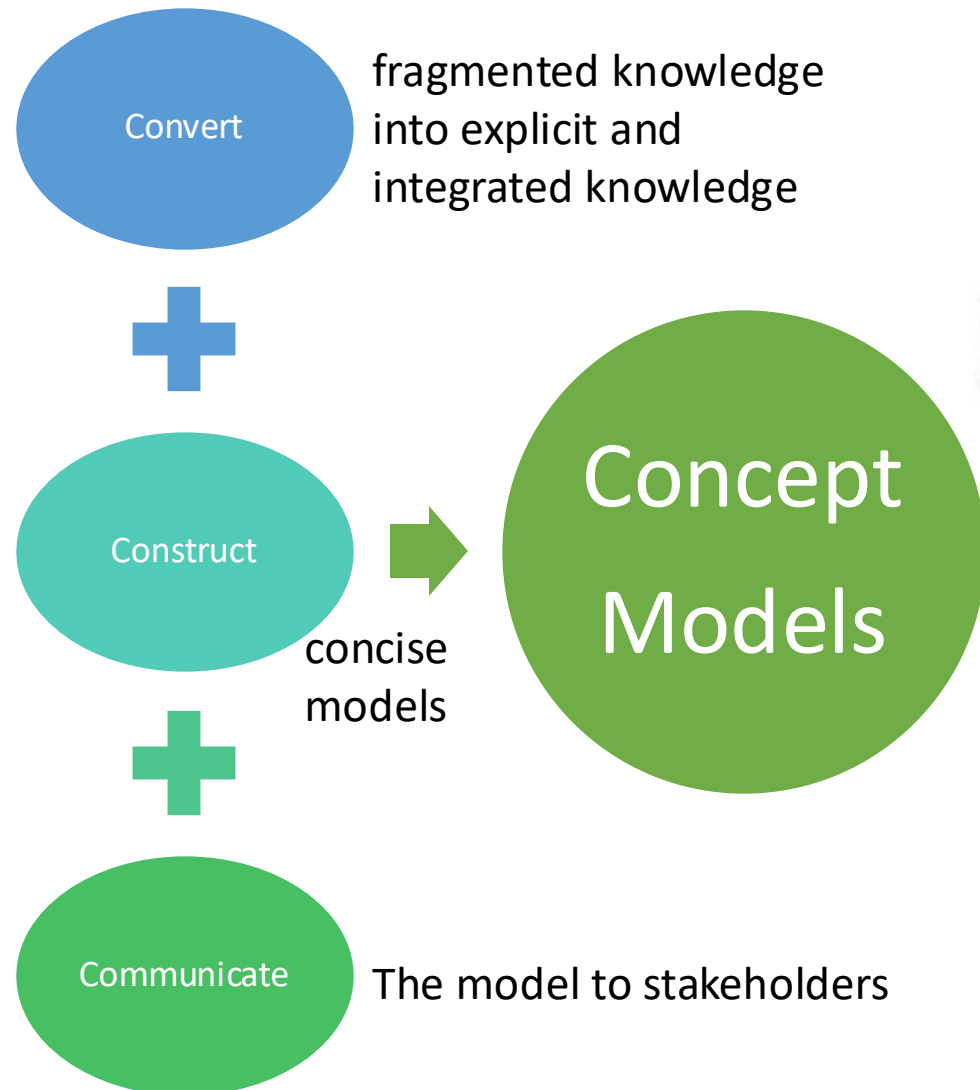

The start:

These “first” ideas → Conceptual Modelling

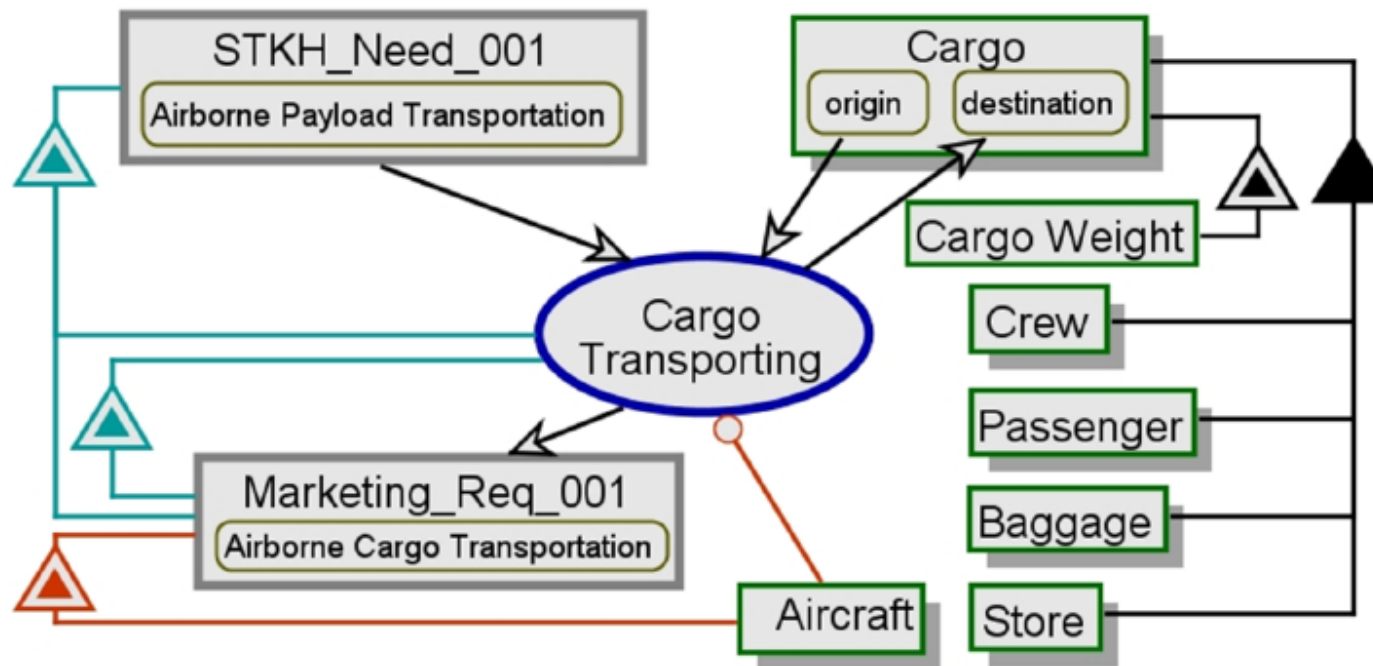

- A **systematic**, formalized process of describing, specifying, designing or explaining ideas, systems, products or processes through a model
- Applicable to both:
 - **Science** – Studying what is known and what is missing to satisfy human thirst for knowledge, and
 - **Engineering** – Designing systems to benefit humans, based on sound scientific principles
- Science can be thought of as reverse engineering of nature

Conceptual Modelling

- **simple** yet **expressive**, and
- **intuitive** yet **formal**

STKH_Need_001 is Airborne Payload Transportation.
 Cargo Transporting consumes STKH_Need_001.
 Cargo Transporting yields Marketing_Req_001.
 Marketing_Req_001 is Airborne Cargo Transportation.
 Marketing_Req_001 exhibits Aircraft.
 Cargo Transporting requires Aircraft.
 Aircraft is physical.
 Cargo Transporting changes Cargo from origin to destination.

Function Defining
 Requirements Identifying
 Requirements Allocating

STKH_Need_001 exhibits Marketing_Req_001, as well as Cargo Transporting.
 Cargo Transporting exhibits Marketing_Req_001.

Traceability

Cargo is physical.
 Cargo can be origin or destination.
 Cargo exhibits Cargo Weight.
 Cargo consists of Passenger, Baggage, Store, and Crew.
 Passenger is physical.
 Baggage is physical.
 Store is physical.
 Crew is physical.

Configuration management

OPM

Prof. Dov Dori

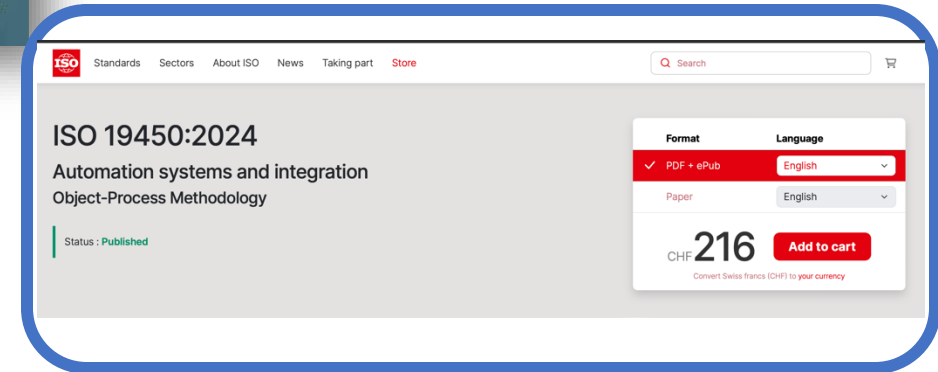

Created in 2002

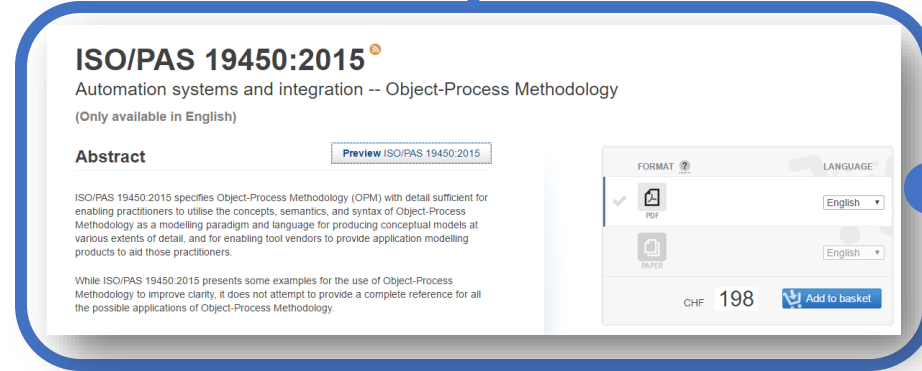

- **A Single Diagram – Maps Behaviour and Structure**
- **2 Building Blocks and 10 basic relations**
- Designed to “Systemic View” and “Concept Modelling”
- Simulation Ready

improving and showing it applicability

- ~130 Pages standard
- Published in late 2015
- Intended to “Automation Systems and Integration”
- Has the “power” of a ISO seal.

Added complexity and integrations

References for this session

- Main:
 - REF-005: DORI, D. Model-Based Systems Engineering with OPM and SysML. New York: Springer, 2016. ISBN 978-1-4939-3294-8.
- OPM Starting Guide
 - <http://esml.iem.technion.ac.il/introduction-to-opm/>
- Absurdly good:
 - https://en.wikipedia.org/wiki/Object_Process_Methodology

Before we start

- Try it: <https://www.opcloud.tech/>
- Only works on Google Chrome (it relies on Google APIs to work)
- There is a “private” / “savable” area, however we are only going to use into this course session.
- If someone (regular student) wants to use during the Years, contact me to add into the Technion’s Server.

LECTURE FINAL REMARKS

62

OPM FOUNDATIONS

[Dori] Fundamental Questions:

- **1. What is needed to describe the universe?**
 - “Things” and their “relations”
- **2. What can those things do?**
 - Things can exist or happen.
- **3. What are the things that exist in the world?**
 - Objects exist – statics (time-independent).
- **4. What are the things that happen in the world?**
 - Processes happen – are dynamics (time-dependent).

[Dori] Fundamental Questions:

- **5. How do objects and processes relate?**
 - Processes happen to objects. While happening,
 - Processes transform objects.
- **6. Transform?? what does that mean?**
 - Create
 - Destroy
 - Affect
 - an object

[Dori] Fundamental Questions:

- **7. Affecting? What does that mean?**
 - A process affects an object by changing its state. Hence, objects must have states.
- **8. What are the two major aspects of any system?**
 - Structure: static aspect – what the system is made of?
 - Behaviour: dynamic aspect - how the system changes over time?
- **9. Which third aspect is specific to man-made systems?**
 - Function: the utilitarian, subjective aspect. Why? for whom? Who benefits?

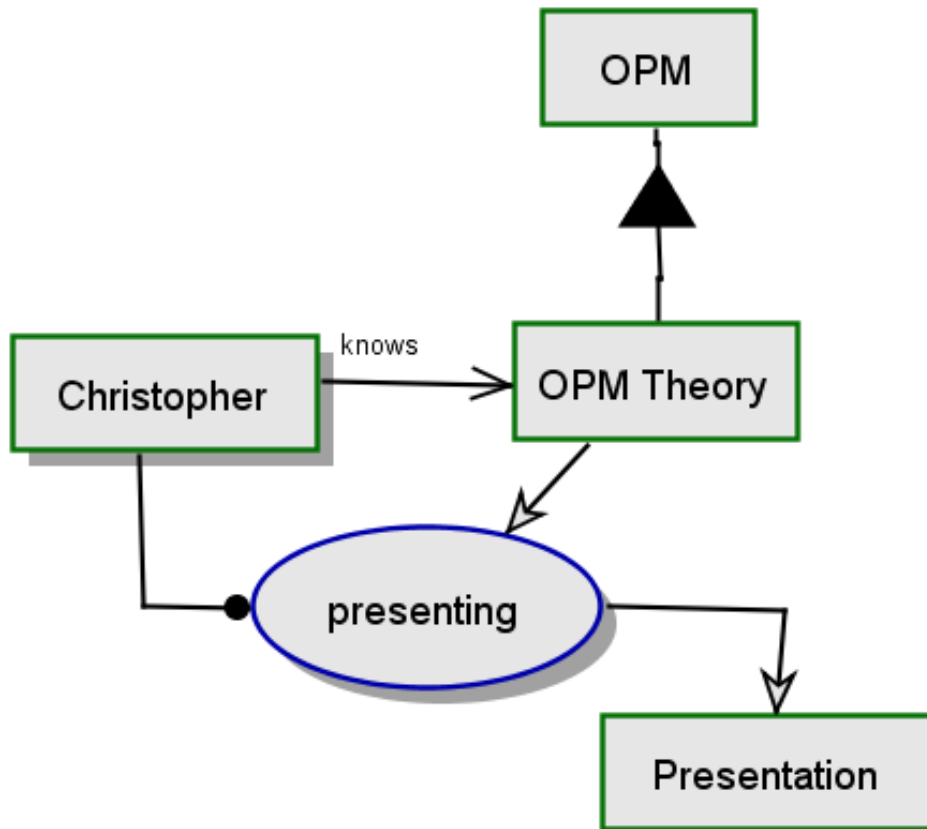

[Dori] Object-Process Theorem

Objects with **states**, **processes**
and their relations among
them constitute a **necessary**
and **sufficient universal**
ontology to describe a **system**.

Cognitive channels: visual-OPD and textual-OPL

OPM FOUNDATIONS

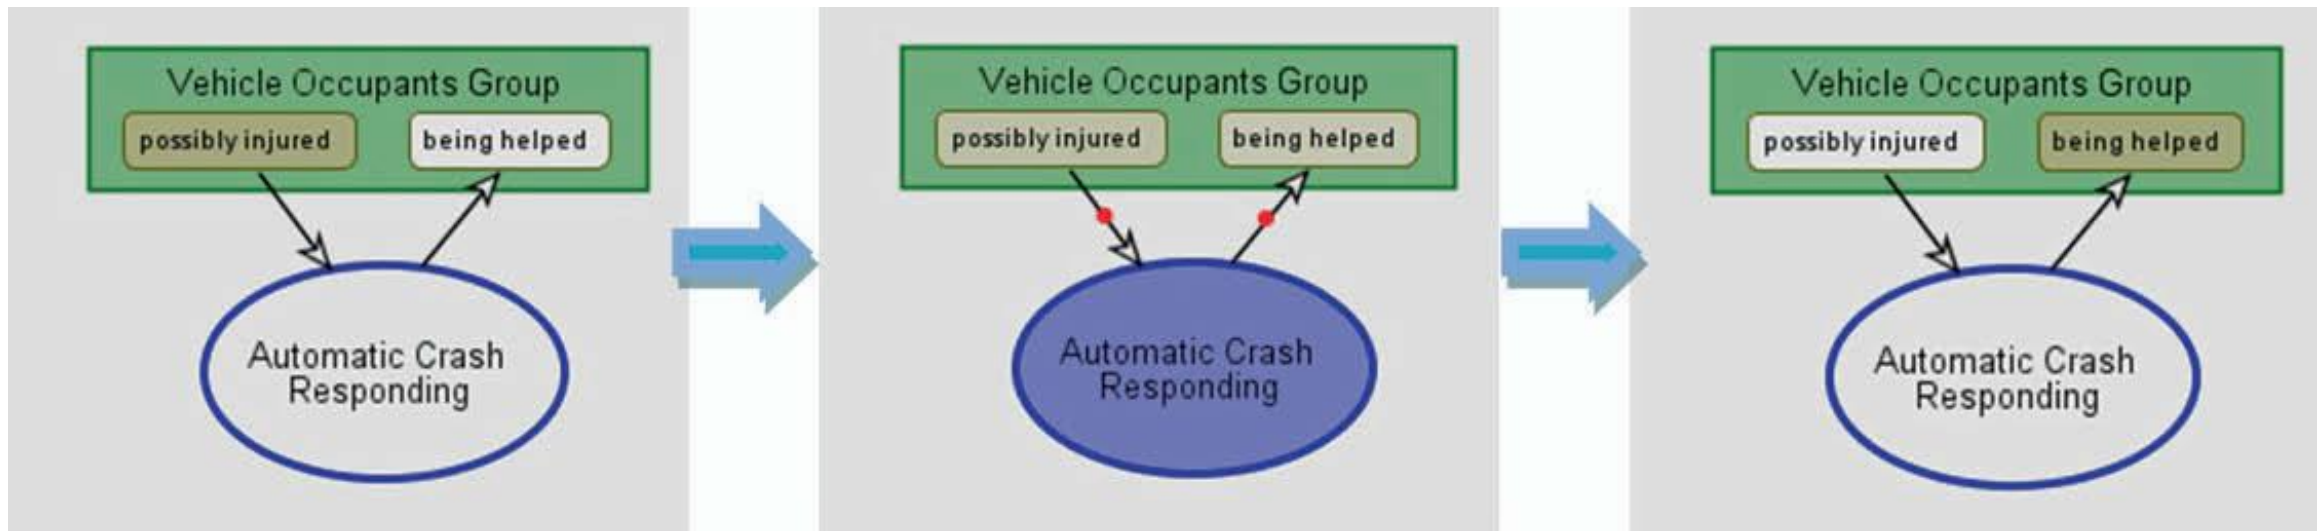

Christopher is physical.
Christopher knows OPM Theory.
Christopher handles presenting.
OPM consists of OPM Theory.
presenting is physical.
presenting consumes OPM Theory.
presenting yields Presentation.

Model simulation

- One of the most attractive and useful features of an OPM model, which enables it to be visualized and tested, is its executability; that is, the ability to simulate a system by executing its model via animation in a properly designed software environment.

robotics laboratories, autonomous cars, and even to outer space!

<https://www.opcloud.tech/>

12 OPM PRINCIPLES

- **1. The Function-as-a-Seed** – Modelling a system starts by defining, naming, and depicting the function of the system, which is also its top-level process.
- **2. The Model Fact Representation** – An OPM model fact needs to appear in at least one OPD in order for it to be represented in the model.
- **3. The Timeline** – The timeline within an in-zoomed process is directed by default from the top of the in-zoomed process ellipse to its bottom

- **4. The Minimal Conceptual Modelling Language** – A symbol system – a language – that can conceptually model a given system using ontology with fewer diagram kinds and fewer symbols and relations among them is preferable over a larger ontology with more diagram kinds and more symbols and relations among them.
- **5. The Thing Importance** – The importance of a thing T in an OPM Model is directly related to the highest OPD in the OPD hierarchy where T appears.

- **6. The Object Transformation by Process** – In a complete OPM Model, each process must be connected to at least one object that the process transforms or one state of the object that the process transforms.
- **7. The Procedural Link Uniqueness** – At any level of detail, no object and a process can be connected with at most one procedural link, which uniquely determines the role of the object with respect to the process.
- **8. The Singular Name** – A name of an OPM thing must be singular. Plural has to be converted to singular by adding the word “Set” for inanimate things or “Group” for humans.

- **9. The Graphics-Text Equivalence** – Any model fact expressed graphically in an OPD is also expressed textually in the corresponding OPL paragraph.
- **10. The Thing Name Uniqueness** – Different things in na OPM Model which are not features must have different names. Features are distinguishable by appending to them the reserved word “of” and the name of their exhibitor.
- **11. The Detail Hierarchy** – Whenever na OPD becomes hard to comprehend due to an excessive amount of details, a new, descendant OPD shall be created.
- **12. The Skip Semantics Precedence** – Skip semantics takes precedence over wait semantics.

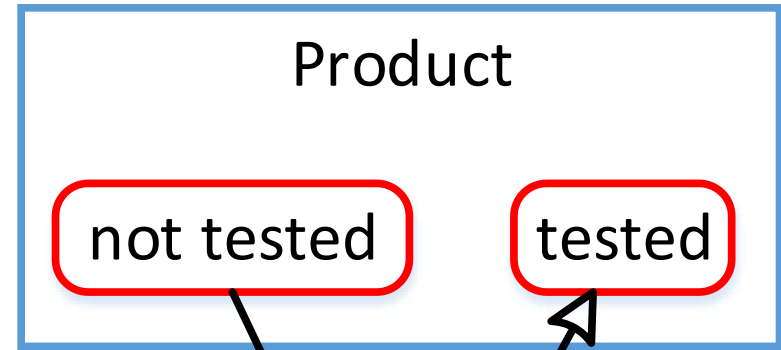

BUILDING BLOCKS

OPM has only two building blocks:

1. Objects with states
A thing that exists or might exist.

2. Processes
A thing that transforms.

All the other elements are **relations** between things, expressed graphically as links

A Object Thing

- An **object** is a **thing** that exists. Its existence can be either physical or conceptual. An **object** is a **thing** that can be transformed.
- An **object** can represent simple things such as car keys, or complex systems such as manufacturing plants.
- The graphical representation of an **object** in
- OPM is a square:

States and Values

- A **state** is a possible situation at which an object can be.
- A **state** is only meaningful in within the context of a containing object.
- The graphical representation of a **state** in OPM is a rountangle (rounded rectangle):

A Process Thing

- A **process** is a thing that transforms an **object**.
- This transformation can be:
 - Creation of an **object**.
 - Consumption of an **object**.
 - Changing the state of an **object**.
- By definition, a process must be associated with at least one object.
- The graphical representation of a process in OPM is an ellipse:

Things Natures

- Things
 - Existential essence
 - Design concern of or system or outside the outside our concern boundary

Essence

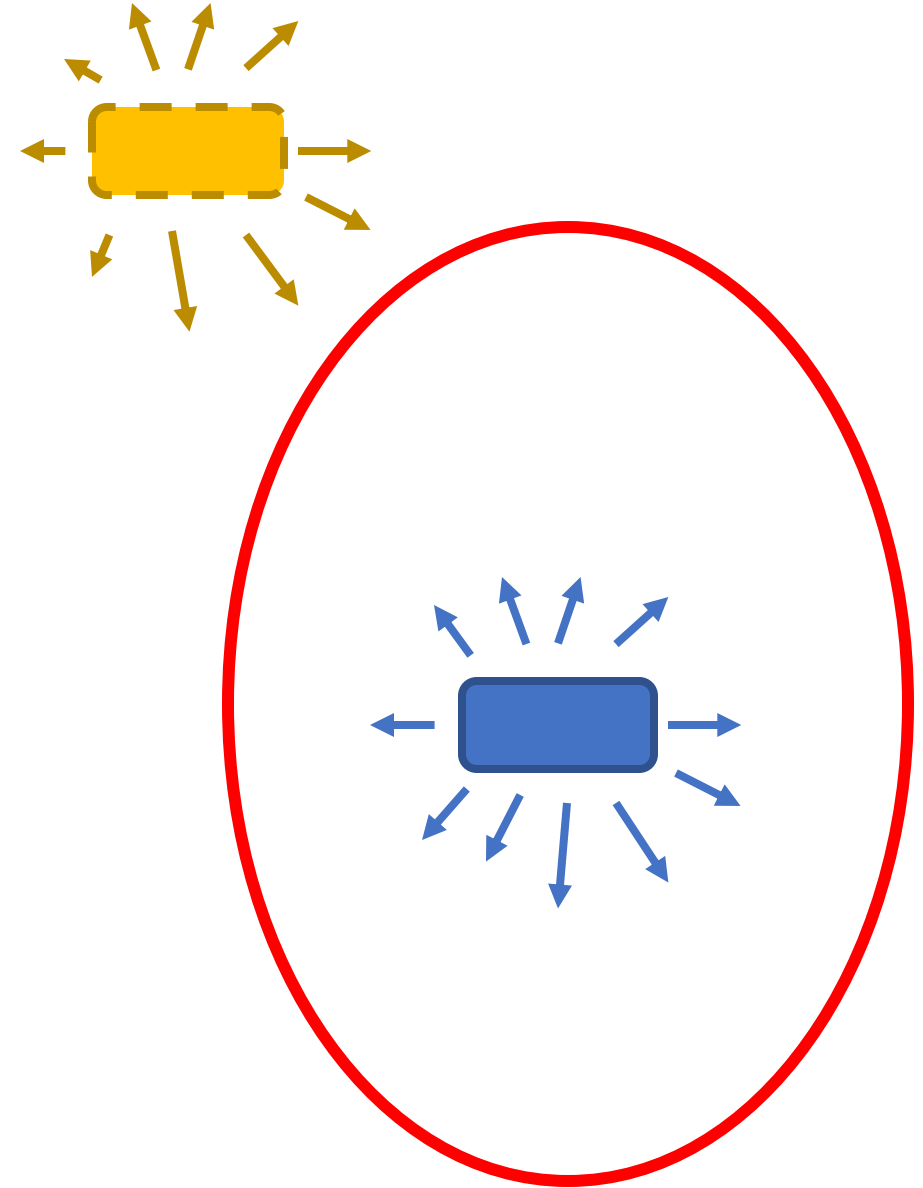

- **Key to modeling Cyber-Physical Systems**
 - **Physical** objects in the model represent what is really “out there” –actual states and values of objects
 - **Informatical** objects represent information about their corresponding physical objects
- Only ***informatical objects*** are available to a decision-making agent (human or artificial)

Affiliation

- **Affiliation**, which pertains to the thing's scope and denotes whether the thing is:
 - **systemic**, i.e. part of the system, or
 - **environmental**, i.e. part of the system's environment.

OBJECT-PROCESS Essence/Affiliation

Informatical Systemic Process is an informatical and systemic process.

Physical Systemic Process is a physical and systemic process.

Informatical Systemic Object is an informatical and systemic object.

Physical Systemic Object is a physical and systemic object.

Informatical Environmental Process is an informatical and environmental process.

Physical Environmental Process is a physical and environmental process.

Informatical Environmental Object is an informatical and environmental object.

Physical Environmental Object is a physical and environmental object.

STRUCTURE

Structural Links

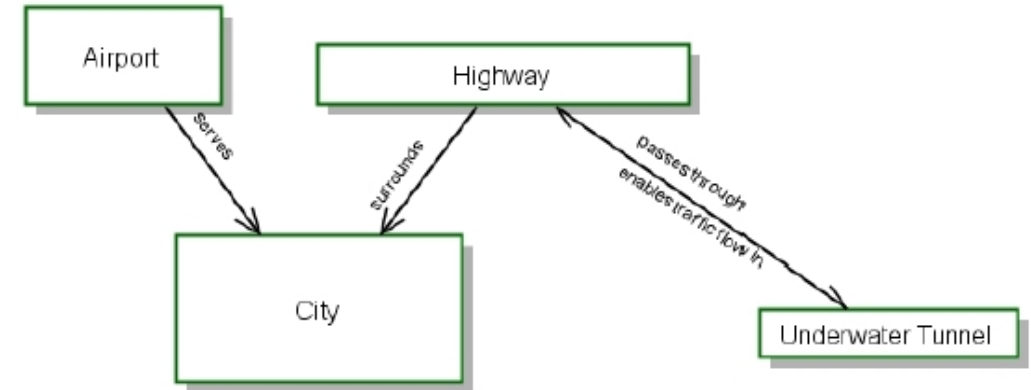

- **Structural Link** is a link that specifies a **static aspect** of the system by connecting an object to another object or a process to another process.

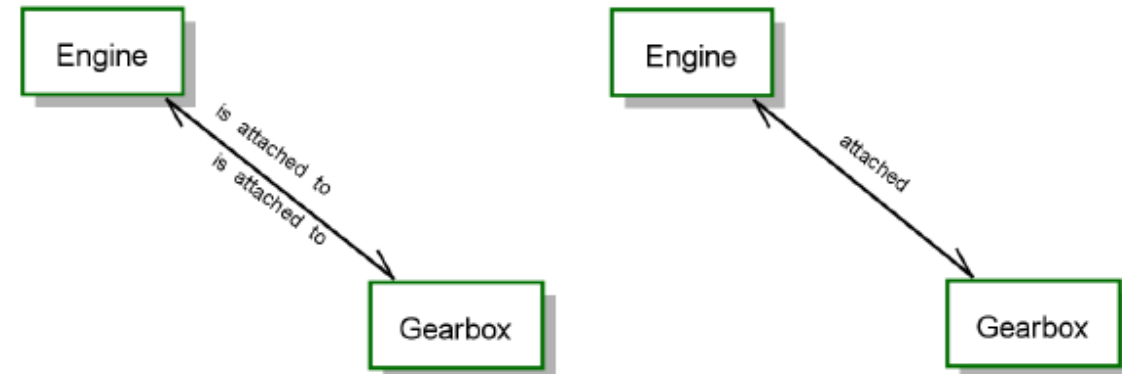

Tagged Structural Links

- A unidirectional tagged structural link defines a structural link between a source **object** and a **target object**.
 - The syntax of the unidirectional tagged structural link OPL sentence shall be: *Source-thing tag Destination-thing*.
 - The syntax of the unidirectional null-tagged structural link OPL sentence shall be: *Source-thing relates to Destination-thing*.
 - The syntax of the reciprocal tagged structural link with only one tag shall be: *Source-thing and Destination-thing are reciprocity-tag*.
 - The syntax of the reciprocal tagged structural link with no tag shall be: *Source-thing and Destination-thing are related*.

Airport serves City.
Highway surrounds City.
Highway passes through Underwater Tunnel.
Underwater Tunnel enables traffic flow in Highway.

Engine is attached to Gearbox.
Gearbox is attached to Engine.

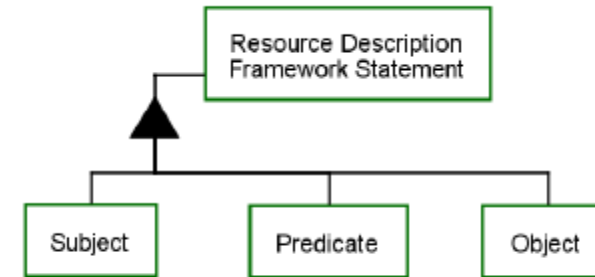

Engine and Gearbox are attached.

Aggregation-Participation

- A structural relation which denotes that one (high level) **thing** aggregates (i.e. consists of, contains) one or more (low level) **things**. The high-level **thing** is called the *whole* or the *aggregate* while the lower-level **things** are called the *parts*.

- The syntax of the aggregation-participation relation link shall be: *Whole-thing* consists of *Part-thing1*, *Part-thing2*, ..., *and Part-thingn*.

Resource Description Framework Statement consists of Subject, Predicate, and Object.

Resource Description Framework Statement consists of Subject, Predicate, and at least one other part.

Exhibition-Characterization

- A structural relation which denotes that one **thing** exhibits (or is characterized) by another **thing**. A **thing** exhibits *features* that characterize it: An *attribute* is a *static feature* & An *operation* is a *dynamic feature*.
- The main difference between exhibition and aggregation is that an attribute always has a value, whether a part may be inexistent: A bag of candies will be empty after Purim (aggregation), but it will always have a color (exhibition).
 - The syntax of the exhibition-characterization relation link for an object exhibitor with a complete collection of n attributes and m operations shall be: **Object-exhibitor exhibits Attribute1, Attribute2, ... , and Attributen, as well as Operation1, Operator2, ... , Operatorm.**
 - The syntax of the exhibition-characterization relation link for a process exhibitor with a complete collection of n operation features and m attribute features shall be: **Process-exhibitor exhibits Operation1, Operator2, ... , Operatorn, as well as Attribute1, Attribute2, ... , and Attributem.**

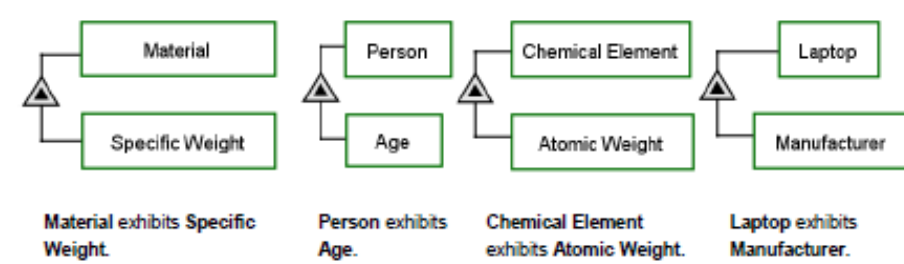

Figure 20 — Object attribute examples

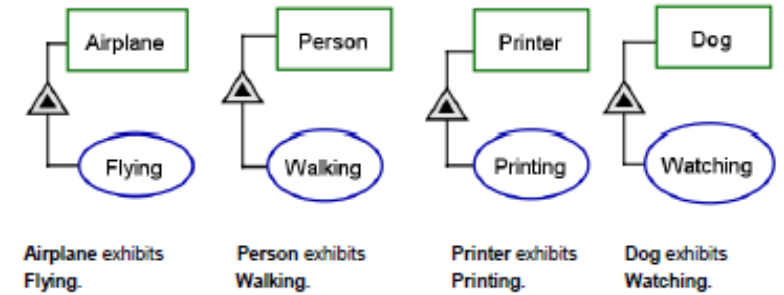

Figure 21 — Object exhibitor with operation examples

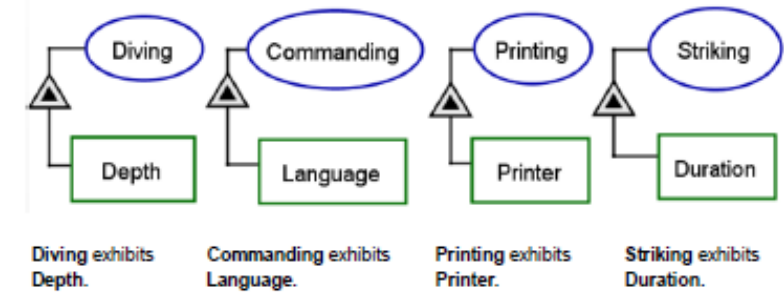

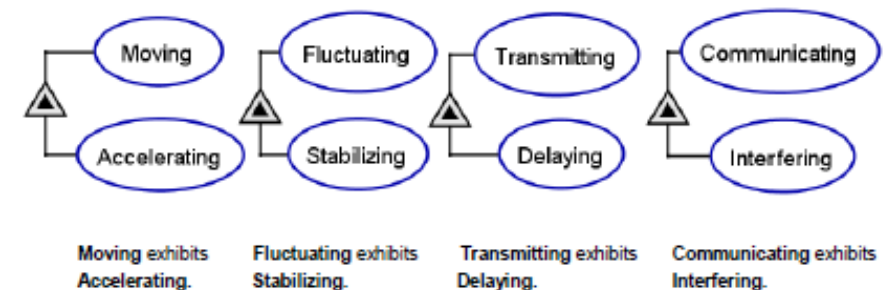

Figure 22 — Process exhibitor with attribute examples

Generalization-Specialization

- A structural relation which denotes that one **thing** specializes to another **thing**.
- Commonly referred as inheritance in OO modelling languages.
 - For a complete collection of n specializations of a general that is an object, the syntax of the generalization-specialization relation link OPL sentence shall be: *Specialization-object1, Specialization-object2, ..., and Specialization-objectn are General-object.*
 - For a complete collection of n specializations of a general that is a process, the syntax of the generalization-specialization relation link OPL sentence shall be: *Specialization-process1, Specialization-process2, ..., and Specialization-processn are General-process.*

STRUCTURE

Digital Camera is a Camera.

Analog Camera and Digital Camera are Cameras.

Hunting is Food Gathering.

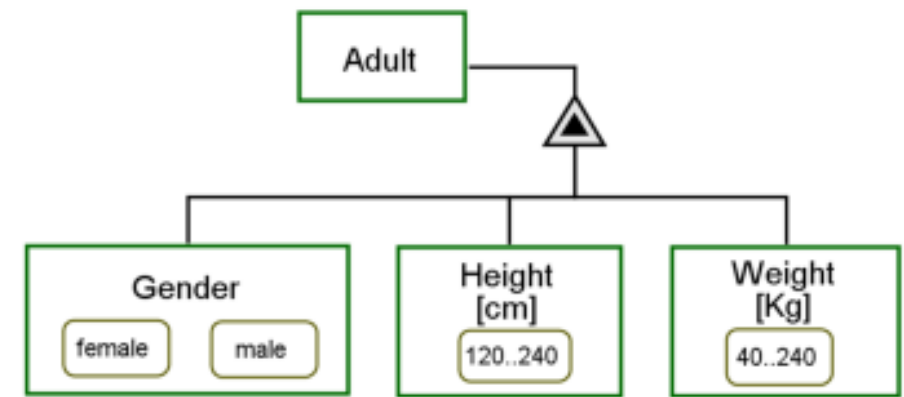

Hunting and Fishing are Food Gathering.

Classification-Instantiation

- The classification, which is an object class or a process class, is a source pattern for a thing connecting with one or more destination things, which are instances of the source thing's pattern, i.e. the qualities the pattern specifies acquire explicit values to instantiate the instance thing.
- An instance of a class shall be an incarnation of a particular identifiable instance of that class with the same classification identifier.
 - The syntax of the classification-instantiation relation link between an object class and a single instance shall be: *Instance-object is an instance of Class-object.*
 - The syntax of the classification-instantiation relation link between a process class and a single instance shall be: *Instance-process is an instance of Class-process.*
 - The syntax of the classification-instantiation relation link between a process class and n instances shall be: *Instance-object1, Instance-object2, ..., Instance-objectn are instances of Class-object.*
 - The syntax of the classification-instantiation relation link between a process class and n instances shall be: *Instance-process1, Instance-process2, ..., Instance-processn are instances of Class-process.*

STRUCTURE

Adult exhibits Gender, Height in cm, and Weight in Kg.
 Gender of Adult can be female or male.
 Height in cm of Adult ranges from 120 to 240.
 Weight in Kg of Adult range from 40 to 240.

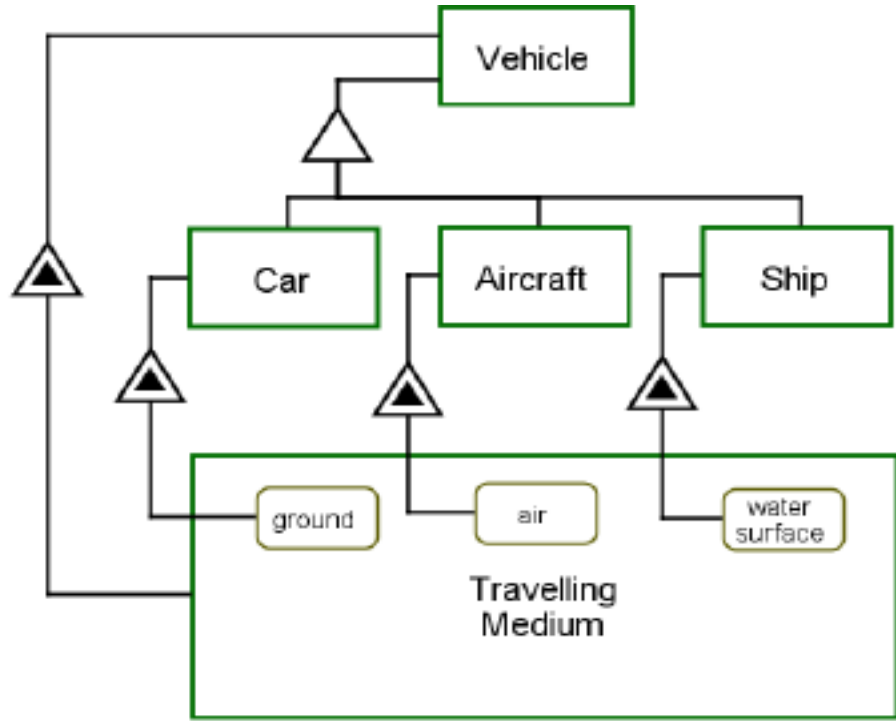

Jack Robinson is an instance of Adult.
 Gender of Jack Robinson is male.
 Height in cm of Jack Robinson is 185.
 Weight in kg of Jack Robinson is 88.

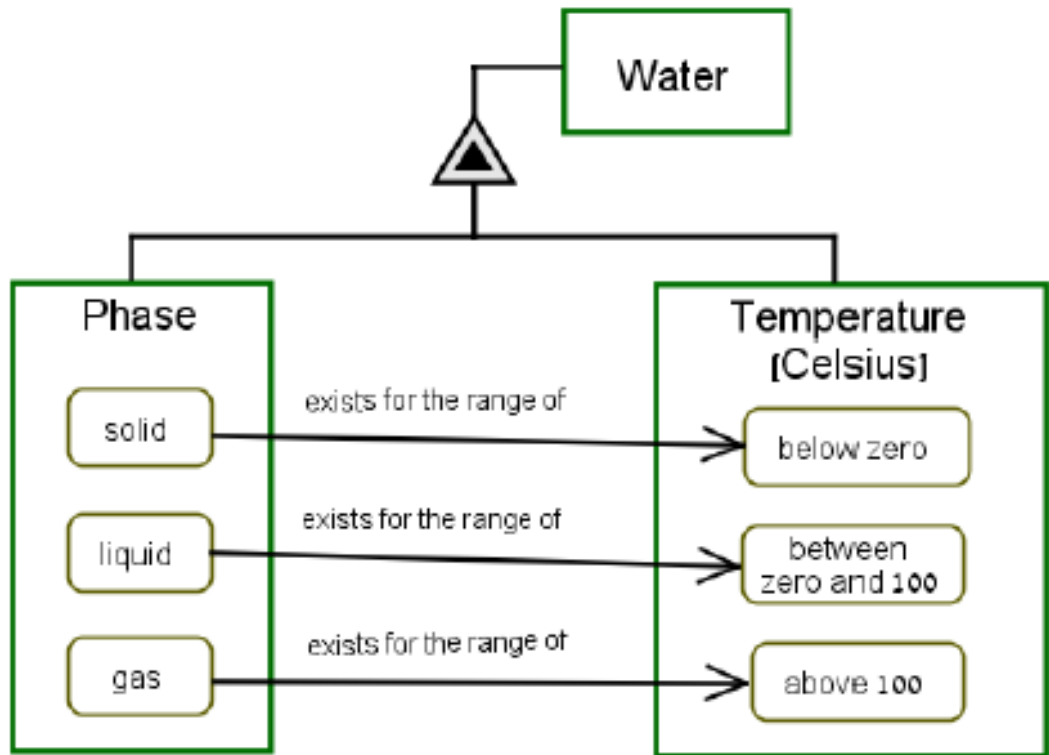

States can be also used in some relations

STRUCTURE

Vehicle exhibits Travelling Medium.
Travelling Medium of Vehicle can be ground, air, and water surface.
Car, Aircraft, and Ship are Vehicles.
Car exhibits ground Travelling Medium.
Aircraft exhibits air Travelling Medium.
Ship exhibits water surface Travelling Medium.

Water exhibits Phase and Temperature in Celsius.
Phase can be solid, liquid, or gas.
Temperature in Celsius can be below zero, between zero and 100, or above 100.
Solid Phase exists for the range of below zero Temperature in Celsius.
Liquid Phase exists for the range of between zero and 100 Temperature in Celsius.
Gas Phase exists for the range of above 100 Temperature in Celsius.

Summary

Aggregation-Participation		Whole consists of Part A and Part B .	-
Exhibition-Characterization		Exhibitor exhibits Attribute A as well as Operation B .	-
Generalization-Specialization		-	Specialization A and Specialization B are General Thing .
Classification-Instantiation		-	Instance A and Instance B are instances of Class .
Unidirectional tagged [Unidirectional null tagged]		Source tag-name Destination . [Source relates to Destination.]	
Bidirectional tagged		A a-to-b tag B . B b-to-a tag A .	
Reciprocal tagged [Reciprocal null tagged]		A and B are reciprocal tag . [A and B are related.]	

BEHAVIOR

Procedural Links

- **Procedural Link** is a link that specifies a **dynamic aspect** of the system by connecting an object (or one of its states) and a process.

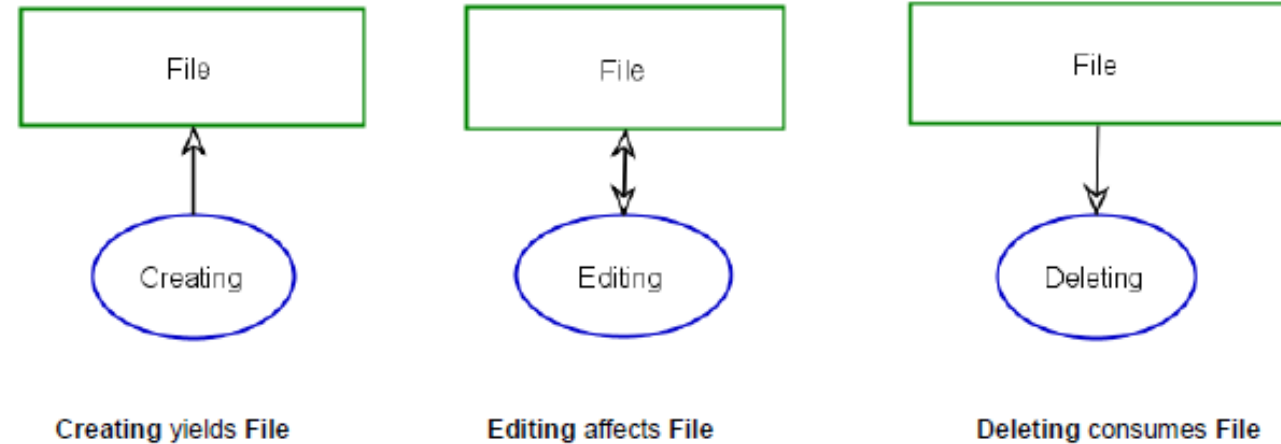

- Procedural links symbolize the behavior of the modeled system.
- Three types:
 - Enabling links: link a **process** to an **object** that enables the **process** but is not affected by it.
 - Transforming links: links a **process** to an **object** that is affected by the **process**.
 - Invocation links: shortcut notation between two consecutive **processes**.

Transforming Links

- A transformation link is a procedural link that connects a process with an object transformed by the process. Three types:
 - **Consumption:** the linked object is consumed and eliminated by the process.
 - **Result:** the linked object is constructed by the process.
 - **Effect:** the linked object is changed by the process.

The syntax of a consumption link OPL sentence shall be: *Processing consumes Consume*.

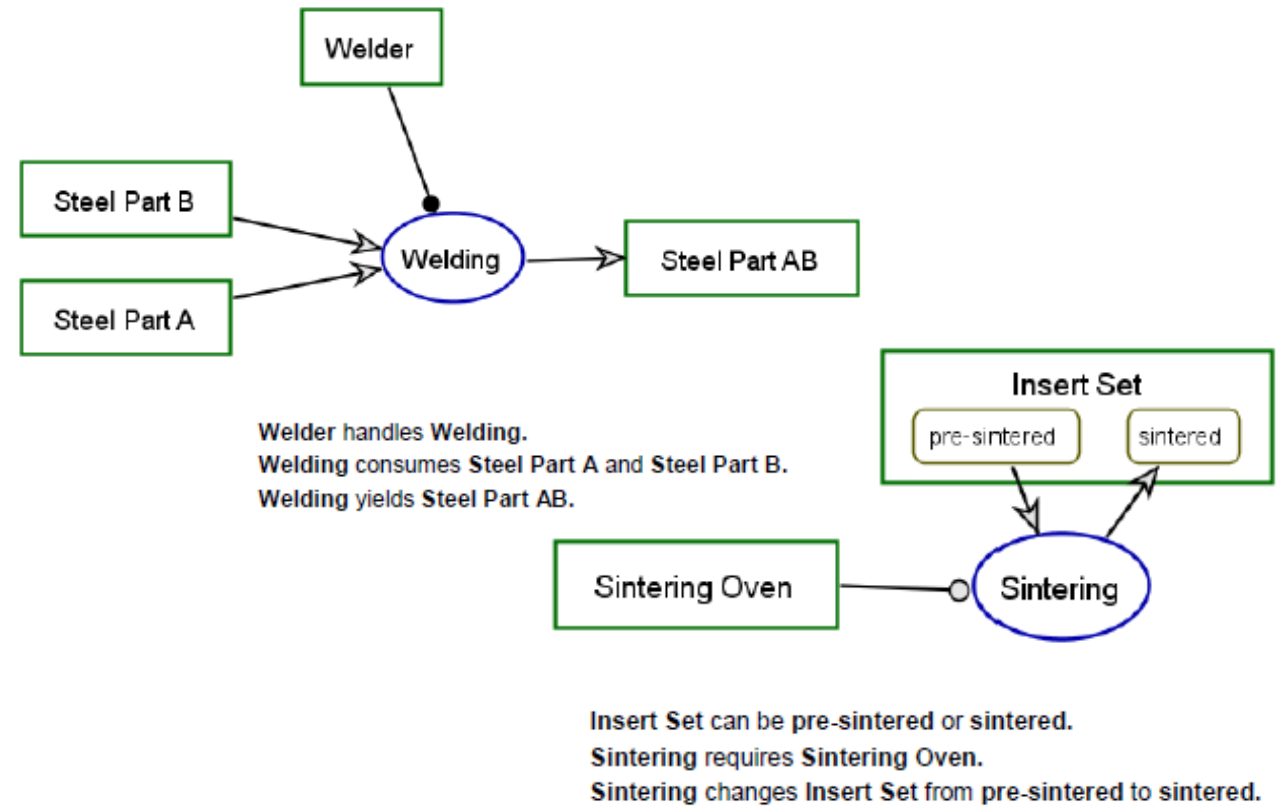

The syntax of a result link OPL sentence shall be: *Processing yields Result*.

The syntax of an effect link OPL sentence shall be: *Processing affects Affect*.

Enabling Links

- An enabling link is a procedural link that connects a process with an enabler object of that process. Two types:
 - **Agent:** an enabler who is a human or a group of humans.
 - **Instrument:** a non-human enabler

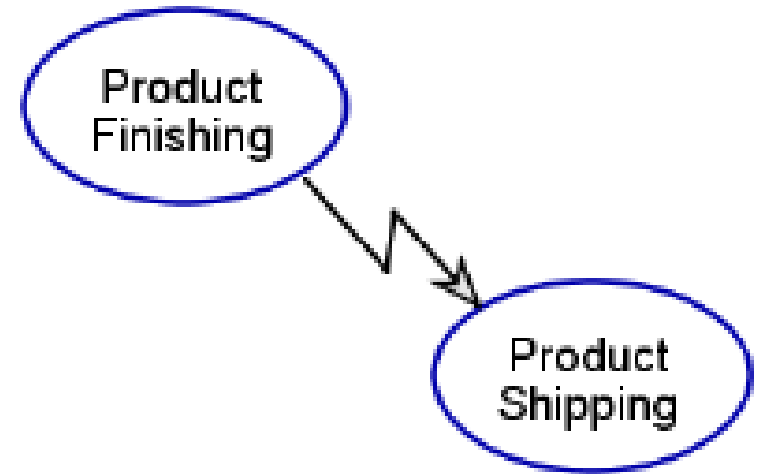

The syntax of an agent link OPL sentence shall be: **Agent handles Processing.**

The syntax of an instrument link OPL sentence shall be: **Processing requires Instrument.**

Invocation Link

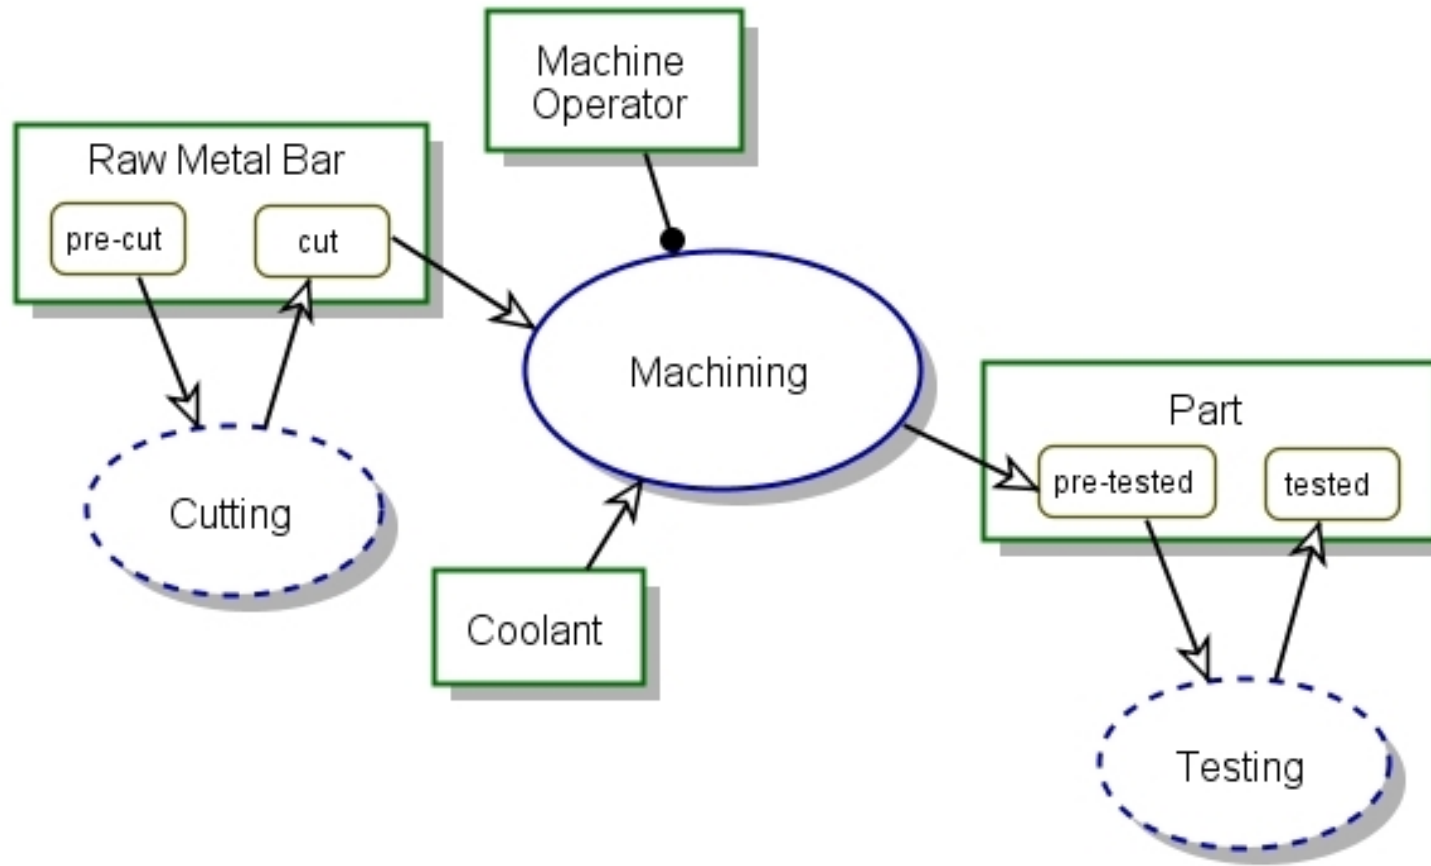

- By definition, a process must transform an object. But sometimes the result of a process is not significant to the system and may be ignored. However, the result of the process is significant to a consecutive process.
- The invocation link provides a shortcut to bypass the modeling of the irrelevant object.
 - The syntax of an invocation link OPL sentence shall be: *Invoking-process invokes invoked-process*.
 - The syntax of a self-invocation link OPL sentence shall be: *Invoking-process invokes itself*.

Product Finishing invokes Product Shipping.

States can be also used in some relations

BEHAVIOR

Raw Metal Bar is physical.
Raw Metal Bar can be pre-cut or cut.
Machine Operator is physical.
Coolant is physical.
Machining is physical.
Machining requires Coolant.
Machine Operator handles Machining.
Part is physical.
Part can be pre-tested or tested.
Testing is environmental and physical.
Cutting changes Raw Metal Bar from pre-cut to cut.
Machining consumes Raw Metal Bar.
Machining yields pre-tested Part.
Testing changes Part from pre-tested to tested.

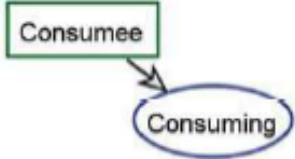

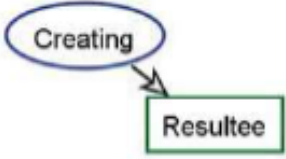

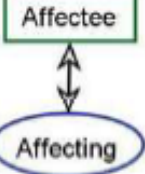

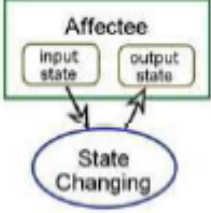

Name	Semantics	Sample OPD & OPL	Source	Destination
State-specified consumption link	The process consumes the object if and only if the object is in the specified state.	<p>Eating consumes edible Food.</p>	consumee state	process
State-specified result link	The process generates the object in the specified state.	<p>Mining yields raw Copper.</p>	process	resultee state
Input-output-specified effect link pair (consisting of one state-specified <i>input link</i> and one state-specified <i>output link</i>)	The process changes the object from a specified input state via the <i>input link</i> to a specified output state via the <i>output link</i> .	<p>Purifying changes Copper from raw to pure.</p>	affectee source state	affecting process
			affecting process	affectee destination state
Input-specified effect link pair (consisting of one state-specified <i>input link</i> and one state-unspecified <i>output link</i>)	The process changes the object from a specified input state to any output state.	<p>Testing changes Sample from awaiting test.</p>	affectee source state	affecting process
			affecting process	affectee
Output-specified effect link pair (consisting of one state-unspecified <i>input link</i> and one state-specified <i>output link</i>)	The process changes the object from any input state to a specified output state.	<p>Cleaning & Painting changes Engine Hood to painted.</p>	affectee	affecting process
			affecting process	affectee destination state

Name	Semantics	Sample OPD & OPL	Source	Destination
State-specified agent link	The human agent enables the process provided she is at the specified state.	<p>Healthy Miner handles Copper Mining.</p>	agent state	enabled process
State-specified instrument link	The process requires the instrument at the specified state.	<p>Copper Mining requires operational Drill.</p>	instrument state	enabled process

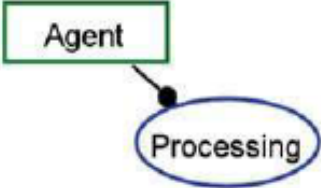

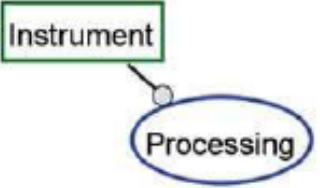

Summary

Procedural transforming links

consumption link	result link	effect link	in-out link pair
 <p>Consuming consumes Consume.</p>	 <p>Creating yields Result.</p>	 <p>Affecting affects Affect.</p>	 <p>State Changing changes Affect from input state to output state.</p>

Procedural enabling links

agent link	instrument link
 <p>Agent handles Processing.</p>	 <p>Processing requires Instrument.</p>

CONDITIONS & EVENTS

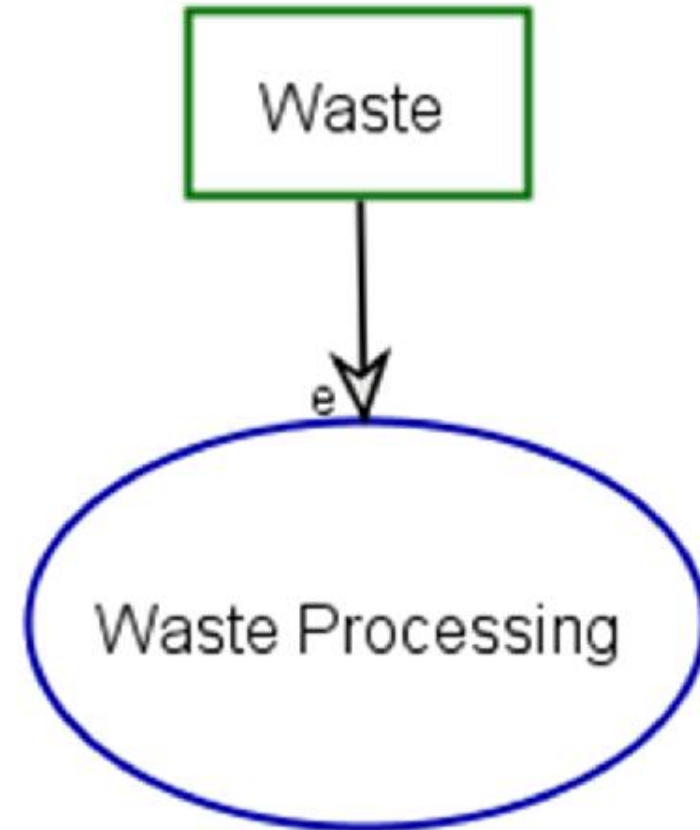

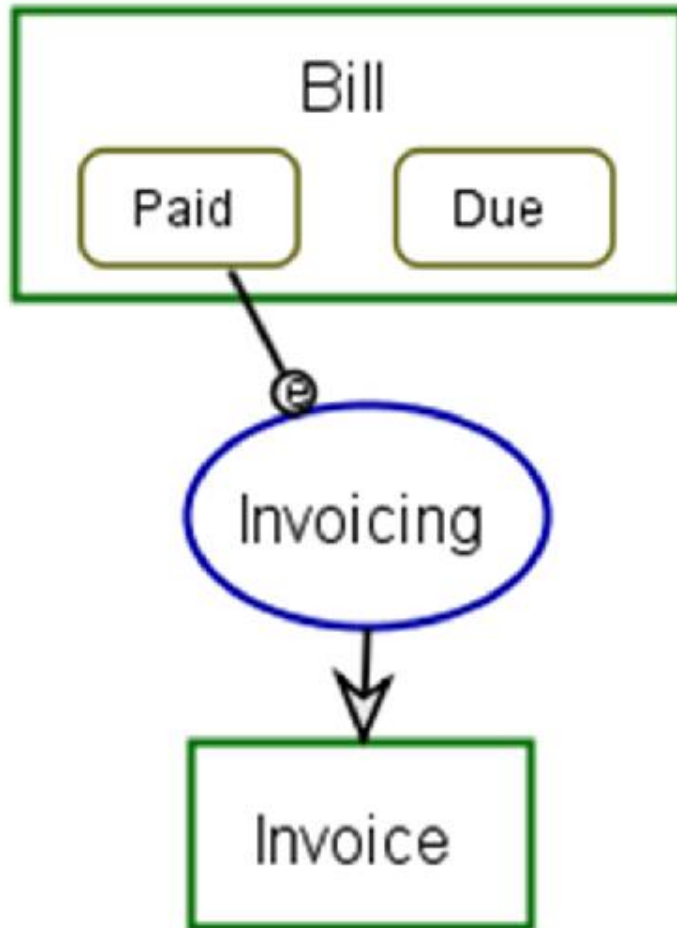

Advanced Procedural Links

- **Event links**: triggers process activation if the event is satisfied. They are **used when agents are not controlling the process**. Two kinds of event links:
 - **Instrument event link**: the process is triggered if the **instrument object exists** (or is in a specific state).
 - **Consumption event link**: the process is triggered if the **consumed object exists** (or is in a specific state). The object is then consumed.
- **Condition link**: conditions the execution of a process to the **existence of an object or to the object being in a specific state**. If the condition is not matched, the process is skipped.

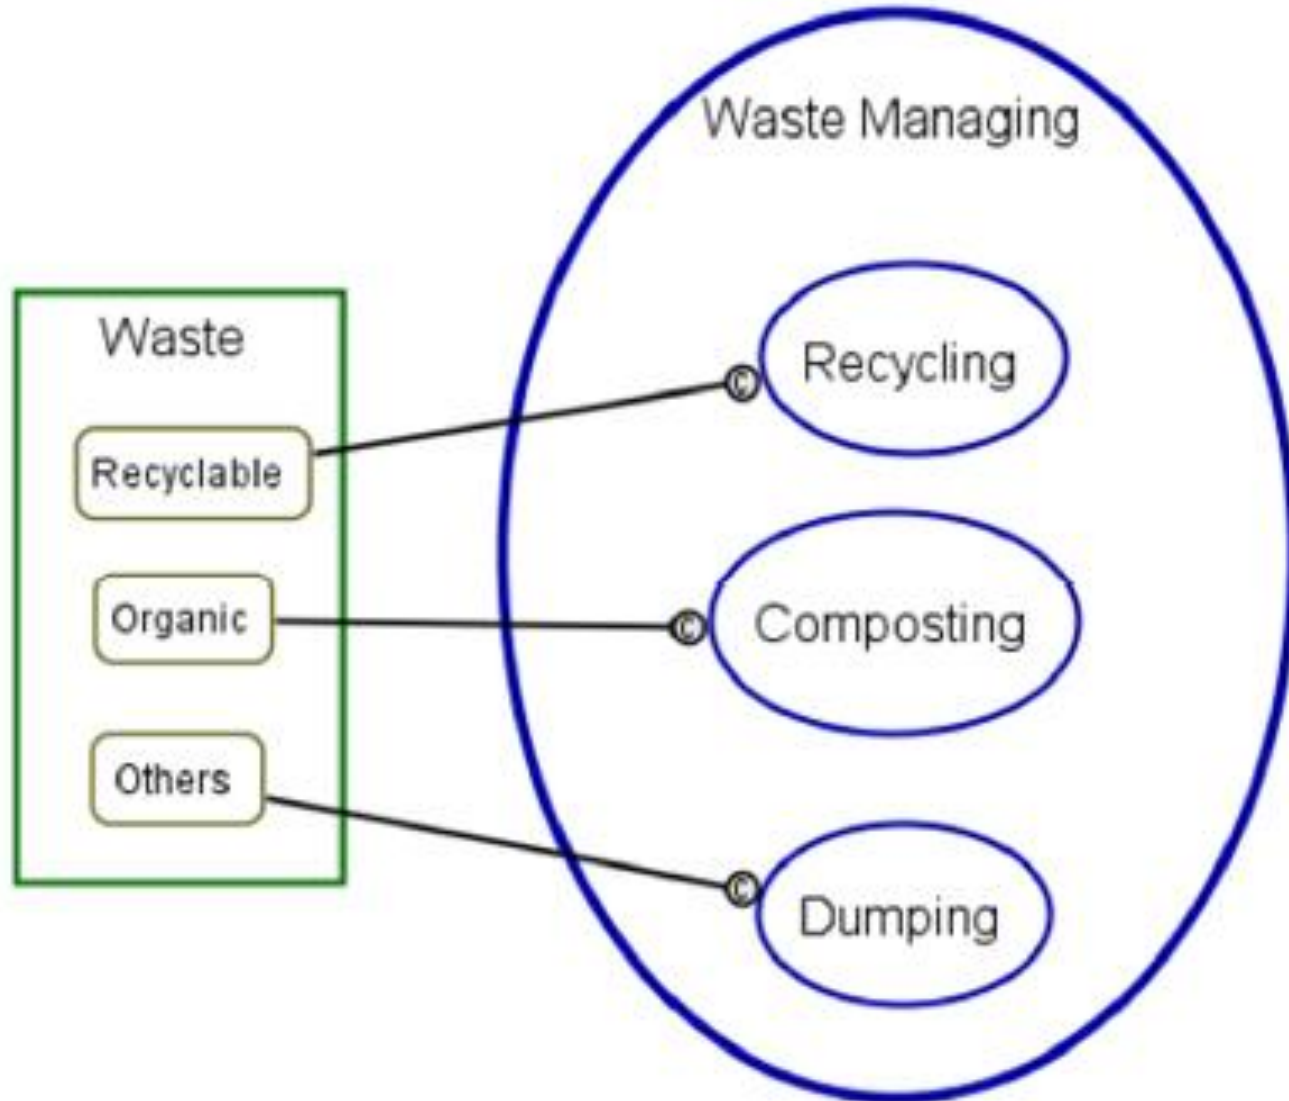

Event Link

Conditional Link

LOGICAL OPERATIONS

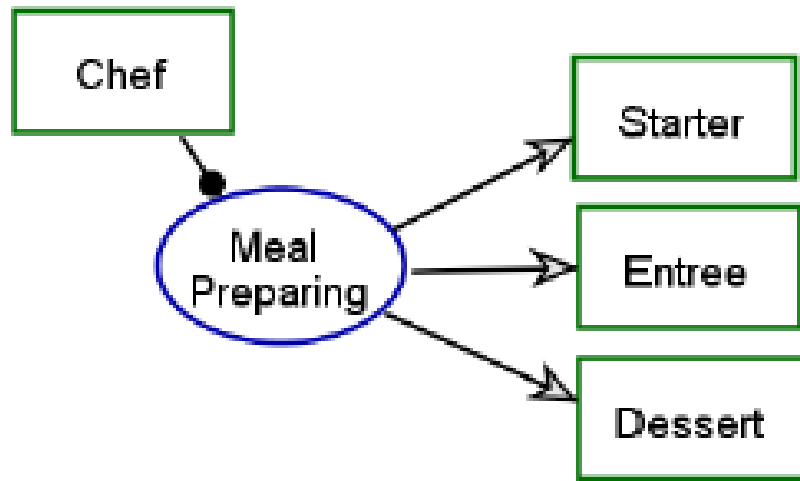

AND, XOR, and OR

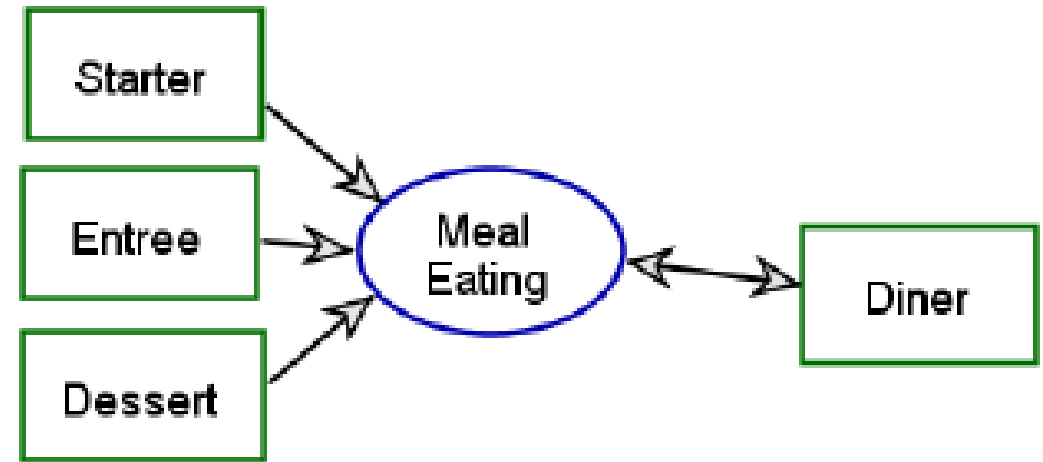

- A group of two or more procedural links of the same kind that originate from, or arrive at, the same process shall have the semantics of logical **AND**.
- A group of two or more procedural links of the same kind that **originate from a common point**, or arrive at a common point, on the same object or process shall be a link fan. A link fan shall follow the semantics of either a **XOR** or an **OR** operator.
 - The **XOR operator** shall mean that **exactly one** of the things at the divergent link end of the link fan exists.
 - The **OR operator** shall mean that **at least one** of the two or more things at the divergent end of the link fan exists.

AND

Chef handles Meal Preparing.
Meal Preparing yields Starter, Entree, and Dessert.

Meal Eating affects Diner.
Meal Eating consumes Dessert, Entree, and Starter.

XOR / OR

Exactly one of **Safe Owner A** and **Safe Owner B** handles **Safe Opening**.

At least one of **Safe Owner A** and **Safe Owner B** handles **Safe Opening**.

Simple Example – Logics

p1 changes a from s1 to s2.

p2 changes a from s1 to s2.

Following path aa, p3 consumes s1 a.
Following path bb, p3 consumes s2 a.
p3 yields s3 a.

p4 changes a from s1 to s3.

LECTURE FINAL REMARKS

Some thoughts

- OPM is **simple and powerful to talk with stakeholders** and create the first architectures
- OPM uses **one diagram type** to handle structure and behavior
 - the language vocabulary has only a **couple of symbols** and **semantics to mimic common sketching**.
- OPM allows simple-formal modelling and enables to **control the complexity**.
- OPM is the only MBSE that **simulates concepts**.
- As it is an ISO, it is **worth a try**.
- OPM **lacks transformational tools** to other domains.

OPM is growing

- OPM main tool is currently the OPCloud (“web” based) ([Model-Based System Engineering | OPCloud | OPM](#))
- It has been highly improved from the OPCat used through the course. ([ESML Lab | OPM | OPCAT Installation \(technion.ac.il\)](#))
 - Usability is better
 - Allows dynamic behavior
 - IoT connectable through MQTT
 - Socket connection
 - Stereotypes
 - Styling
 - Timing
